Midterm Reference Sheet

Pandas and Matplotlib

df is a DataFrame; s is a Series.

Function	Description
df[col]	Returns the column labeled co1 from df as a Series.
df[[col1, col2]]	Returns a DataFrame containing the columns labeled col1 and col2.
<pre>s.loc[rows] / df.loc[rows, cols]</pre>	Returns a Series/DataFrame with rows (and columns) selected by their index values.
<pre>s.iloc[rows] / df.iloc[rows,</pre>	Returns a Series/DataFrame with rows (and columns) selected by their positions.
<pre>s.isnull() / df.isnull()</pre>	Returns boolean Series/DataFrame identifying missing values
s.fillna(value) / df.fillna(value)	Returns a Series/DataFrame where missing values are replaced by value
<pre>s.dropna() / df.dropna()</pre>	Returns Series/DataFrame with missing entries dropped from it
<pre>df.drop(labels, axis)</pre>	Returns a DataFrame without the rows or columns named labels along axis (either 0 or 1)
<pre>df.rename(index=None,</pre>	Returns a DataFrame with renamed columns from a dictionary index and/or columns
df.sort_values(by, ascending=True)	Returns a DataFrame where rows are sorted by the values in columns by
<pre>s.sort_values(ascending=True)</pre>	Returns a sorted Series.
<pre>s.isin(values) / df.isin(values)</pre>	Returns Series/DataFrame with True/False depending on whether the entry is among the values.
s.unique()	Returns a NumPy array of the unique values
<pre>s.value_counts()</pre>	Returns the number of times each unique value appears in a Series
<pre>pd.merge(left, right, how='inner', on='a')</pre>	Returns a DataFrame joining DataFrames left and right on the column labeled a ; the join is of type inner
<pre>left.merge(right, left_on=col1,</pre>	Returns a DataFrame joining DataFrames left and right on columns labeled col1 and col2.
<pre>df.set_index(col)</pre>	Returns a DataFrame that uses the values in the column labeled col as the row index.
<pre>df.reset_index(col)</pre>	Returns a DataFrame that has row index 0, 1, etc., and adds the current index as a column.

Groups, Strings, & Plots

grouped = df.groupby(by) where by can be a column label or a list of labels.

Description	Function
Aggregates using the given function f	grouped.agg(f)
Return a Series containing size of each group, including missing values	<pre>grouped.size()</pre>
Return a Series/DataFrame containing mean/min/max of each group for each column, excluding missing values	<pre>grouped.mean() / grouped.min() / grouped.max()</pre>
Filters using the given function f	<pre>grouped.filter(f)</pre>

Description	Function
Returns a Series containing length of each string	s.str.len()
Returns a Series containing lowercase/uppercase version of each string	<pre>s.str.lower()/s.str.upper()</pre>
Returns a Series after replacing occurences of substrings matching regular expression pat with string repl	s.str.replace(pat, repl)
Returns a boolean Series indicating whether a substring matching the regular expression pat is contained in each string	s.str.contains(pat)
Returns a Series of the first subsequence of each string that matches the regular expression pat . If pat contains one group, then only the substring matching the group is extracted	s.str.extract(pat)

x and y are sequences of values.

Description	Function
Creates a line plot of x against y	plt.plot(x, y)
Creates a scatter plot of x against y	<pre>plt.scatter(x, y)</pre>
Creates a histogram of x; bins can be an integer or a sequence	<pre>plt.hist(x, bins=None)</pre>
Creates a bar plot of categories x and corresponding heights height	<pre>plt.bar(x, height)</pre>

Regular Expressions

List of all metacharacters: . ^ \$ * + ?] [\ | () { }

Operator	Description
	Matches any character except \n
1	Escapes metacharacters
I	Matches expression on either side of expression; has lowest priority of any operator
\d, \w, \s	Predefined character group of digits (0-9), alphanumerics (a-z, A-Z, 0-9, and underscore), or whitespace, respectively
\D, \W, \S	Inverse sets of \d, \w, \s, respectively
*	Matches preceding character/group zero or more times
?	Matches preceding character/group zero or one times
+	Matches preceding character/group one or more times
*?, +?	Applies non-greedy matching to * and +, respectively
{m}	Matches preceding character/group exactly <i>m</i> times
{m, n}	Matches preceding character/group at least m times and at most n times; if either m or n are omitted, set lower/upper bounds to 0 and ∞ , respectively
^, \$	Matches the beginning and end of the line, respectively
[]	Matching group used to match any of the specified characters or range (e.g. [abcde]) [a-e])
()	Capturing group used to create a sub-expression
[^]	Invert matching group; e.g. [^a-c] matches all characters except a, b, c
	Function Description

re.match(pattern, string)	Returns a match if zero or more characters at beginning of string matches pattern, else None
re.search(pattern, string)	Returns a match if zero or more characters anywhere in $\ \mbox{string}\ \mbox{matches}\ \mbox{pattern}$, else None
re.findall(pattern, string)	Returns a list of all non-overlapping matches of pattern in string (if none, returns empty list)
re.sub(pattern, repl, string)	Returns string after replacing all occurrences of pattern with repl

Description

Function
